# Motivation

Periodic triangulations: Euclidean vs hyperbolic

# Motivation

## Applications

[Sausset, Tarjus, Viot]

[Chossat, Faye, Faugeras]

[Balazs, Voros]

# Motivation

## Beautiful groups

- Fuchsian groups
- finitely presented groups
- triangle groups
- ...

# State of the art

## Closed Euclidean manifolds

- Algorithms 2D [Mazón, Recio], 3D [Dolbilin, Huson],  $d$ D [Caroli, Teillaud, DCG'16]
- Software (square/cubic flat torus) 2D [Kruithof], 3D [Caroli, Teillaud]

The logo for CGAL (Computational Geometry Algorithms Library) features the letters 'C', 'G', and 'A' in a yellow, serif font, each with a small geometric diagram (a triangle, a square, and a circle) integrated into its design. The letter 'L' is in a plain yellow font.

## Closed hyperbolic manifolds

- Algorithms 2D, genus 2 [Bogdanov, Teillaud, Vegter, SoCG'16]
- Software (Bolza surface) [I., Teillaud, SoCG'17]

The logo for CGAL (Computational Geometry Algorithms Library) features the letters 'C', 'G', and 'A' in a yellow, serif font, each with a small geometric diagram (a triangle, a square, and a circle) integrated into its design. The letter 'L' is in a plain yellow font.

Poincaré model of the hyperbolic plane  $\mathbb{H}^2$ 

# Hyperbolic translations

# Hyperbolic translations

non-commutative!

# Bolza surface

What is it?

- Closed, compact, orientable surface of genus 2.
- Constant negative curvature  $\rightarrow$  locally hyperbolic metric.
- The most symmetric of all genus-2 surfaces.

# Bolza surface

Fuchsian group  $\mathcal{G}$  with finite presentation

$$\mathcal{G} = \langle a, b, c, d \mid abcd\bar{a}\bar{b}\bar{c}\bar{d} \rangle$$

$\mathcal{G}$  contains only translations (and  $\mathbb{1}$ )

Bolza surface

$$\mathcal{M} = \mathbb{H}^2 / \mathcal{G}$$

with projection map  $\pi_{\mathcal{M}} : \mathbb{H}^2 \rightarrow \mathcal{M}$

# Bolza surface

Fuchsian group  $\mathcal{G}$  with finite presentation

$$\mathcal{G} = \langle a, b, c, d \mid abcd\bar{a}\bar{b}\bar{c}\bar{d} \rangle$$

$\mathcal{G}$  contains only translations (and  $\mathbb{1}$ )

Bolza surface

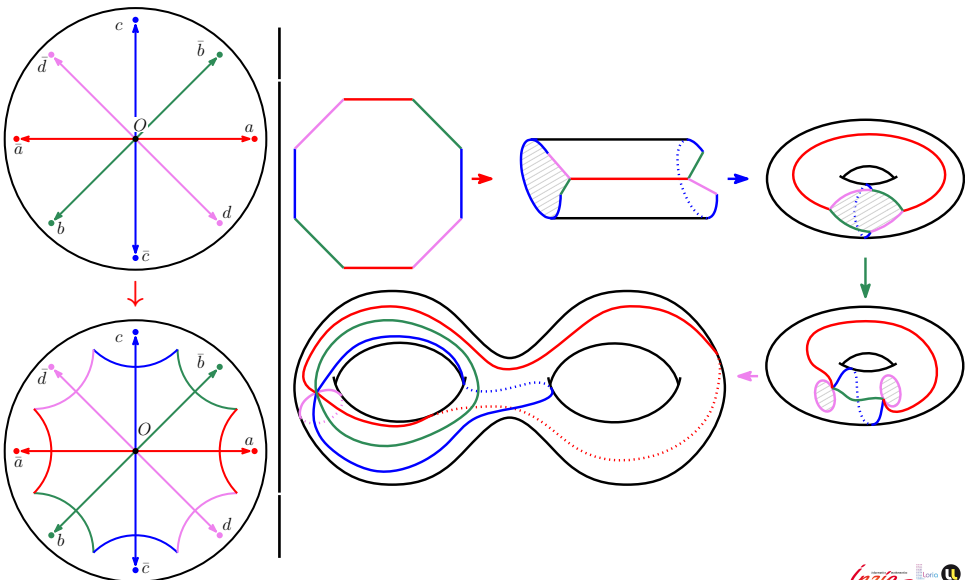

$$\mathcal{M} = \mathbb{H}^2 / \mathcal{G}$$

with projection map  $\pi_{\mathcal{M}} : \mathbb{H}^2 \rightarrow \mathcal{M}$

$$\mathcal{A} = [a, \bar{b}, c, \bar{d}, \bar{a}, b, \bar{c}, d] = [g_0, g_1, \dots, g_7]$$

$$g_k = \begin{bmatrix} \alpha & \beta_k \\ \bar{\beta}_k & \bar{\alpha} \end{bmatrix}, \quad g_k(z) = \frac{\alpha z + \beta_k}{\bar{\beta}_k z + \bar{\alpha}}, \quad \alpha = 1 + \sqrt{2}, \quad \beta_k = e^{ik\pi/4} \sqrt{2\alpha}$$

## Bolza surface

# Hyperbolic octagon

Voronoi diagram of  $\mathcal{G}O$

# Hyperbolic octagon

Fundamental domain  $\mathcal{D}_O =$  Dirichlet region of  $O$

# Hyperbolic octagon

“Original” domain  $\mathcal{D}$ : contains exactly one point of each orbit

# Outline

- 1 | Introduction
- 2 | The Bolza Surface
- 3 | Background from [BTV, SoCG'16]
- 4 | Data Structure
- 5 | Incremental Insertion
- 6 | Results
- 7 | Future work

# Criterion

Systole  $\text{sys}(\mathcal{M}) =$  minimum length of a non-contractible loop on  $\mathcal{M}$

# Criterion

Systole  $\text{sys}(\mathcal{M}) =$  minimum length of a non-contractible loop on  $\mathcal{M}$

# Criterion

Systole  $\text{sys}(\mathcal{M}) =$  minimum length of a non-contractible loop on  $\mathcal{M}$

# Criterion

$\text{Systole } \text{sys}(\mathcal{M}) =$ 
minimum length of a  
non-contractible loop on  $\mathcal{M}$

# Criterion

Systole  $\text{sys}(\mathcal{M}) =$  minimum length of a non-contractible loop on  $\mathcal{M}$

$$\pi_{\mathcal{M}}(DT_{\mathbb{H}}(\mathcal{G}S))$$

# Criterion

Systole  $\text{sys}(\mathcal{M}) =$  minimum length of a non-contractible loop on  $\mathcal{M}$

$S$  set of points in  $\mathbb{H}^2$   
 $\delta_S =$  diameter of largest disks in  $\mathbb{H}^2$  not containing any point of  $\mathcal{G}_S$

$$\delta_S < \frac{1}{2} \text{sys}(\mathcal{M})$$

$\Rightarrow \pi_{\mathcal{M}}(DT_{\mathbb{H}}(\mathcal{G}_S)) = DT_{\mathcal{M}}(S)$   
 is a simplicial complex

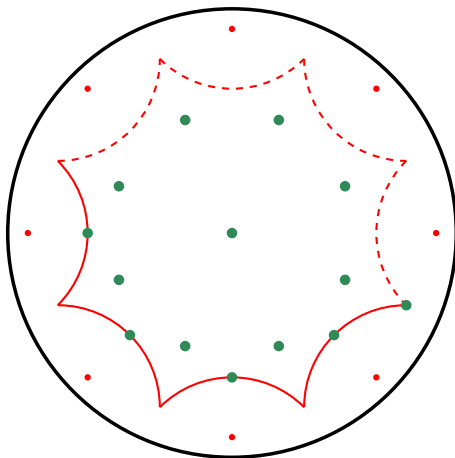

$\Rightarrow$  The usual incremental algorithm can be used

[Bowyer]

# Systole on the octagon

# Set of dummy points

# Set of dummy points vs. criterion

# Delaunay triangulation of the dummy points

# Delaunay triangulation of the Bolza surface

Algorithm:

- 1 initialize with dummy points
- 2 insert points in  $S$
- 3 remove dummy points

# Outline

## Notation

$g(O)$ ,  $g \in \mathcal{G}$ , denoted as  $g$

$\mathcal{D}_g = g(\mathcal{D}_O)$ ,  $g \in \mathcal{G}$

$\mathcal{N} = \{g \in \mathcal{G} \mid \mathcal{D}_g \cap \mathcal{D}_O \neq \emptyset\}$

$\mathcal{D}_{\mathcal{N}} = \bigcup_{g \in \mathcal{N}} \mathcal{D}_g$

# Property of $DT_{\mathbb{H}}(\mathcal{G}S)$

$S \subset \mathcal{D}$  input point set  
 s.t. criterion  $\delta_S < \frac{1}{2} \text{sys}(\mathcal{M})$  holds

$\sigma$  face of  $DT_{\mathbb{H}}(\mathcal{G}S)$  with at least one  
 vertex in  $\mathcal{D}$

→  $\sigma$  is contained in  $\mathcal{D}_{\mathcal{N}}$

# Canonical representative of a face

Each face of  $DT_{\mathcal{M}}(S)$  has infinitely many pre-images in  $DT_{\mathbb{H}}(\mathcal{G}S)$

# Canonical representative of a face

at least one pre-image with at least one vertex in  $\mathcal{D}$

# Canonical representative of a face

Case: face with 3 vertices in  $\mathcal{D}$

# Canonical representative of a face

Case: face with 3 vertices in  $\mathcal{D}$

# Canonical representative of a face

Case: face with 3 vertices in  $\mathcal{D}$

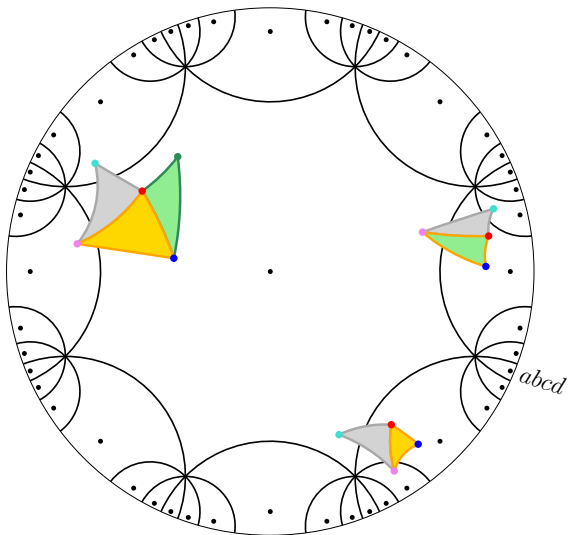

# Canonical representative of a face

Case: face with 2 vertices in  $\mathcal{D}$

# Canonical representative of a face

Case: face with 2 vertices in  $\mathcal{D}$

# Canonical representative of a face

Case: face with 2 vertices in  $\mathcal{D}$

# Canonical representative of a face

Case: face with 1 vertex in  $\mathcal{D}$

# Canonical representative of a face

Case: face with 1 vertex in  $\mathcal{D}$

# Canonical representative of a face

## CGAL Triangulations

Face of  $DT_M(S)$ 

Face of  $DT_M(S)$

# Point Location

# Point Location

# Point Location

# Point Location

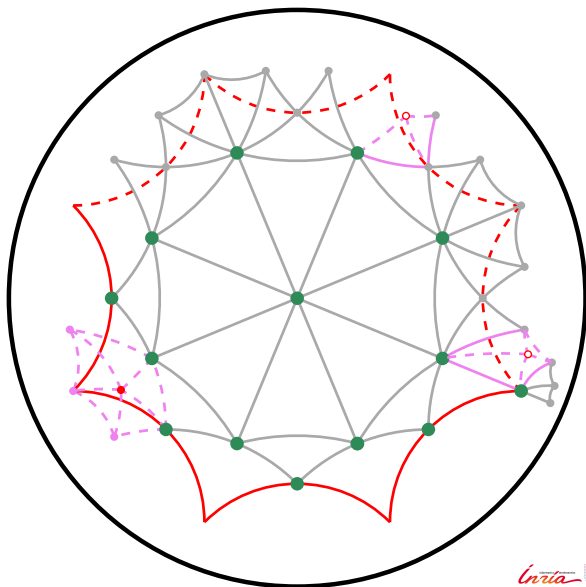

# Point Insertion

“hole” = topological disk

# Point Insertion

“hole” = topological disk

# Point Insertion

Computations  
on translations

Dehn's algorithm  
(slightly modified)

# Predicates

$$\text{Orientation}(p, q, r) = \text{sign} \begin{vmatrix} p_x & p_y & 1 \\ q_x & q_y & 1 \\ r_x & r_y & 1 \end{vmatrix}$$

$$\text{InCircle}(p, q, r, s) = \text{sign} \begin{vmatrix} p_x & p_y & p_x^2 + p_y^2 & 1 \\ q_x & q_y & q_x^2 + q_y^2 & 1 \\ r_x & r_y & r_x^2 + r_y^2 & 1 \\ s_x & s_y & s_x^2 + s_y^2 & 1 \end{vmatrix}$$

# Predicates

Suppose that the points in  $S$  are **rational**.

Input of the predicates can be images of these points under  $\nu \in \mathcal{N}$ .

$$g_k(z) = \frac{\alpha z + e^{ik\pi/4} \sqrt{2\alpha}}{e^{-ik\pi/4} \sqrt{2\alpha} z + \alpha}, \quad \alpha = 1 + \sqrt{2}, \quad k = 0, 1, \dots, 7$$

- the *Orientation* predicate has algebraic degree at most 20
- the *InCircle* predicate has algebraic degree at most 72

Point coordinates represented with **CORE: :Expr**

→ (filtered) exact evaluation of predicates

# Outline

- 4 | Data Structure
- 5 | Incremental Insertion
- 6 | Results**
- 7 | Future work

# Demo

The code is on GitHub! Let's see a demo.

# Experiments

Fully dynamic implementation

1 million random points

-  Euclidean DT (double) ~ 1 sec.
-  Euclidean DT (CORE::Expr) ~ 13 sec.
- Hyperbolic periodic DT (CORE::Expr) ~ 34 sec.

# Experiments

## Fully dynamic implementation

### 1 million random points

-  Euclidean DT (double) ~ 1 sec.
-  Euclidean DT (CORE::Expr) ~ 13 sec.
- Hyperbolic periodic DT (CORE::Expr) ~ 34 sec.

## Predicates

- 0.76% calls to predicates involving translations in  $\mathcal{N}$
- responsible for 36% of total time spent in predicates

Dummy points can be removed after insertion of 17–72 random points.

- 4 | Data Structure
- 5 | Incremental Insertion
- 6 | Results
- 7 | Future work

# Future work

- Implement 2D periodic hyperbolic mesh
- Algorithm for:
  - More general genus-2 surfaces
  - Surfaces of genus  $> 2$

Thank you for your attention!
